

Granule Analyzer

Short click guide

1. start Granule-Analyzer.exe, this small window will pop up

2. open and load an image into program

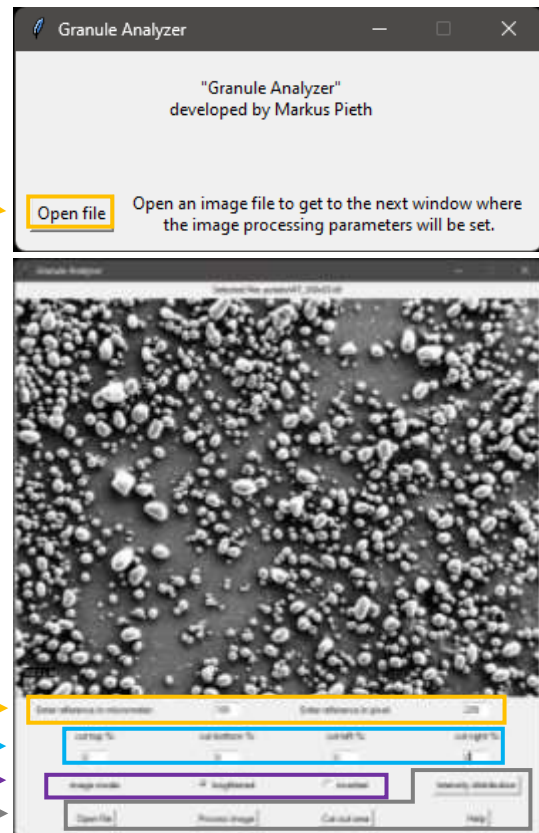

3. enter reference values in μm and pixel

4. entry fields for cutting off image sides

5. choosing image mode

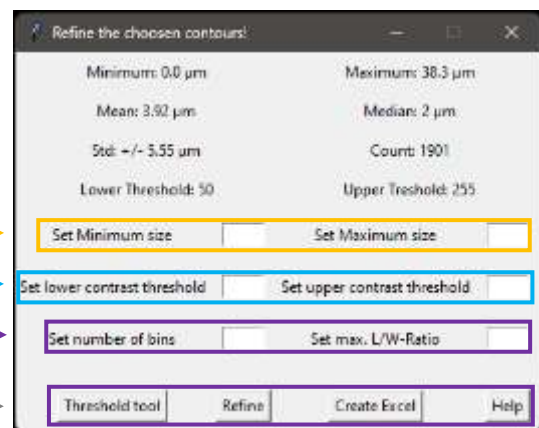

6. function calling buttons

- open another image file
- start first image processing/analysis
- cut out defined area
- help table with reference values
- showing pixel intensity distribution

7. refinement window with descriptive statistics

- enter min. and max. granule size to be included
- enter threshold values to define pixels of detectable outlines
- number of bins for histogram and maximal length to width ratio of granules to be included

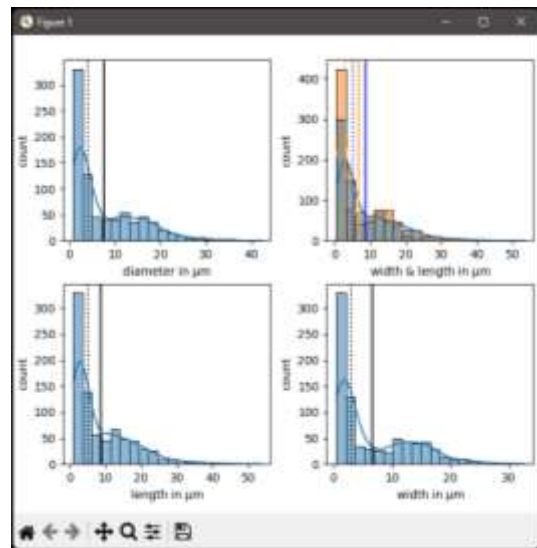

8. function calling buttons

- opening Threshold tool to help finding optimal threshold values
- refine analysis with refinement parameters set
- saving last analysis results into an excel workbook ("your_file_name.xlsx")
- helping information about the refinement parameters and diagram window

9. feedback window showing included contours in yellow and excluded ones in blue accordingly to the refinement parameters set before

10. diagram window visualizing the descriptive/distribution statistics of the latest analysis and offering some function for zooming, cutting, lay out and file-saving

11. After having saved the results to an excel workbook, close all windows except the second one from above, open another image file and start over from point 3. or close everything when finished.
